DashFood

Cafe online ordering system

SE-2622
Artur, Adiyat, Erdaulet
Final ICT Project
8 November 2026

Problem and users

Customers need a clear menu and a reliable pickup order.

Customers browse, check the cart and track preparation.
Staff receive orders, update status and control availability.

Evidence: documented Stage 1 problem and reproducible interface findings.
Real queue reduction has not been measured.

As-built architecture

Phone or laptop browser

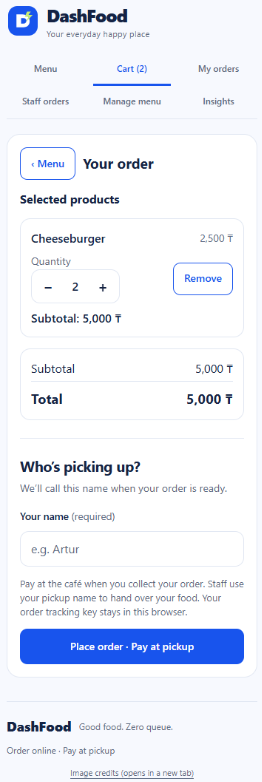

Responsive React web app
Cart and secret order receipts

Wi-Fi / internet / loopback

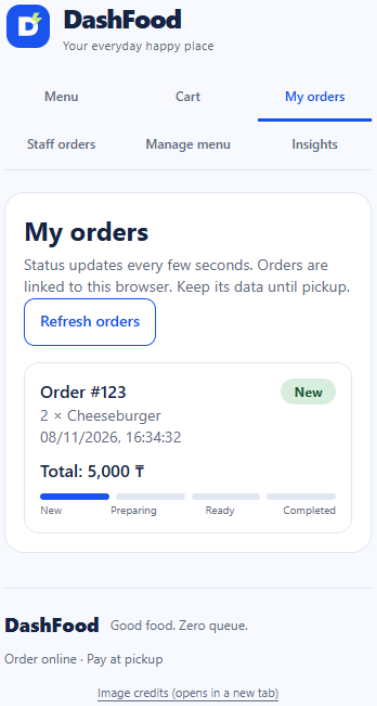

Node HTTPS or Caddy TLS
Express API and PostgreSQL 16

Public: menu and validated checkout
Customer receipt key: own order read
Staff JWT: orders, menu writes, Insights

Customer live demonstration

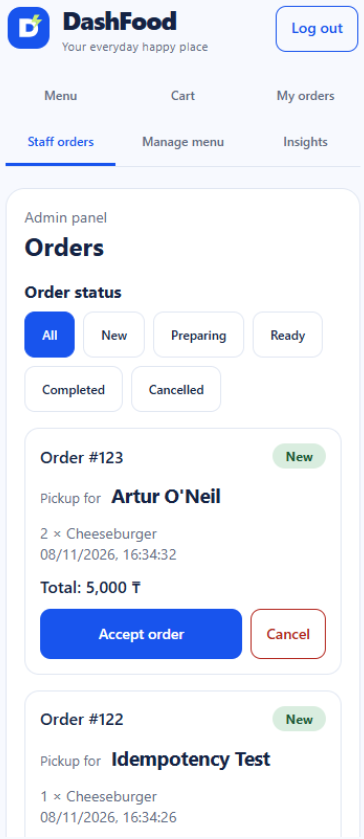

Cart, quantity and pickup name

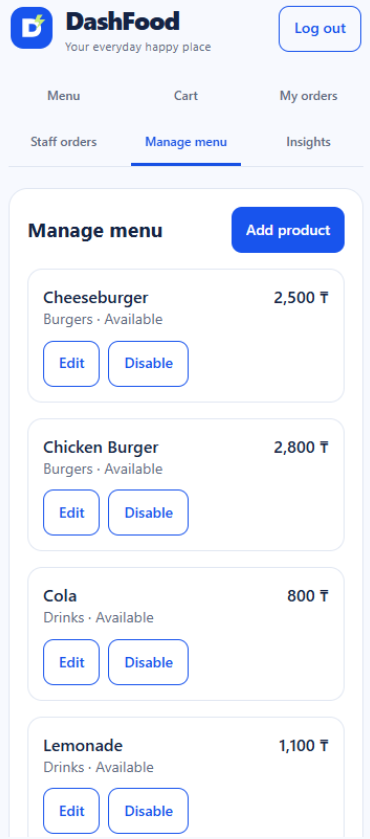

Saved order and tracking status

Staff live demonstration

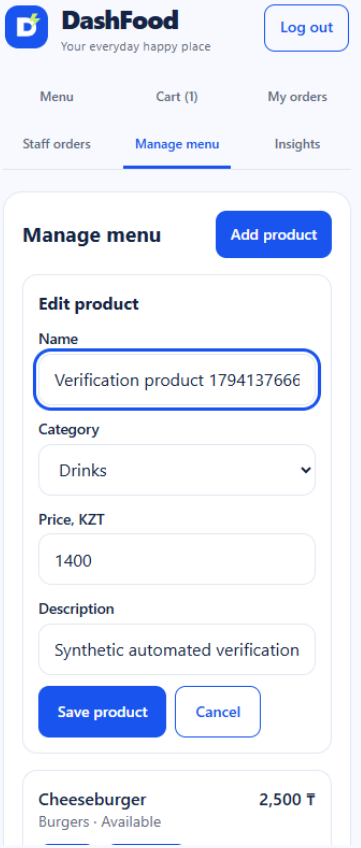

Receive, prepare and mark Ready

Edit products and disable availability

Resolved Stage 2 findings

F01 All mobile routes remain visible
F02 Search ignores surrounding spaces
F03 Editing opens a visible, focused form

The regression checks cover 320, 360, 375, 768 and 1440px.

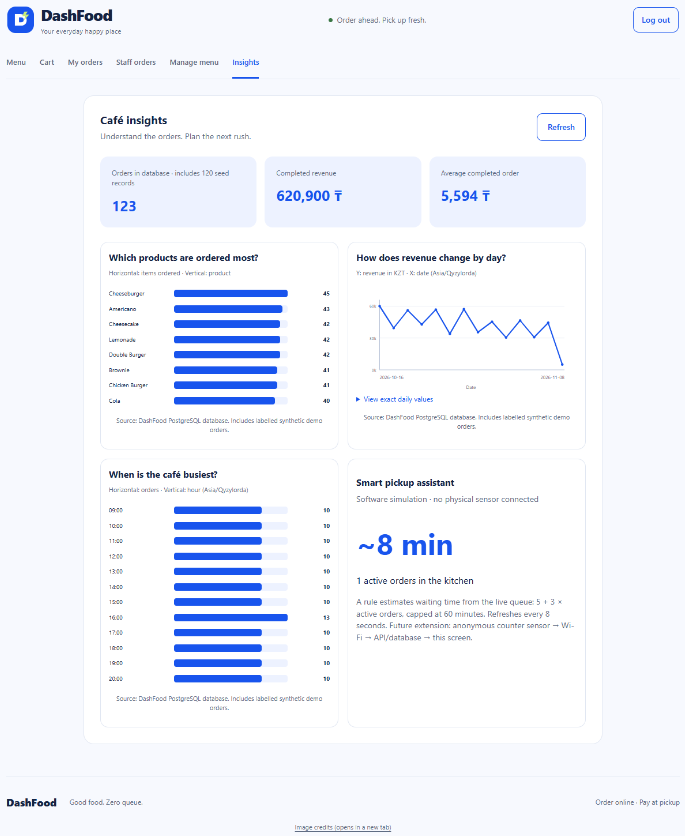

Final verification and original criteria

53 API checks pass

Original Stage 1 criterion	Final result	Evidence limit
Order in less than 2 minutes	Human time unmeasured	Participants were not timed
Reject unavailable products	Automated pass	Record external observation
Interface works at 360px	Automated pass	Record external observation

Six WCAG A/AA scans detect zero violations in the tested scope.
Automated runs do not replace the three external users.

Data analysis from the shared database

123 orders
120 flagged seed records
620,900 KZT completed total

Popularity, daily revenue and hourly orders answer different questions.
All assessment records are synthetic.

Smart pickup simulation

min(60, 5 + 3 × active orders)

New and Preparing orders form the active queue.
Insights refreshes every eight seconds.

No physical sensor is connected.
The formula has not been calibrated to kitchen preparation times.

Lessons and remaining evidence

A shared database makes the customer and staff journey verifiable.

Complete timed external retests and personal signed statements.
Confirm trusted HTTPS and measure availability over a declared period.
Each member reviews and commits their own current contribution.
